Technical Skills

Programming Languages: Python, Java, Javascript, C++, Rust, C#

Frameworks: Spring Boot, React, Flask, Express, TypeScript, Node.js

Developer Tools: AWS, MySQL, MongoDB, OOP, Tailwind, REST, Docker, Redis, PostgreSQL, CI/CD, NoSQL, AI, Version control systems (Git, Github)

Work Experience

3BX - Software Development Engineer Internship

August 2024 – April 2025

- Shipped user-facing dashboard generator; feature flags + A/B tests every week.
- Applied SDLC (Software Development Lifecycle) & AI principles while writing technical documentation to improve written and verbal communication skills between the team.
- Wrote 200+ Pytest cases; pipeline fails < 90 % coverage, zero regressions in 3 releases

Pineville Initiative - Backend Software Development Intern

January 2024 - April 2024

- Introduced Redis cache layer, cutting database load and saving \$400/month in RDS costs, demonstrating cost-effective solutions and performance optimization.
- Delivered CMS data-visualization module in Java; serves 50k daily API calls showcasing proficiency in backend development and distributed systems to solve complex problems.
- Wrote unit tests pipeline passes > 95%, highlighting attention to detail and robust troubleshooting skills.

Projects

Frontend Tutor

React, MySQL, Python

<https://frontendtutor-1.onrender.com>

- Led 5-person Agile team (Scrum, 2-week sprints); shipped React + Java platform with lesson search, progress tracking, demonstrating leadership to communicate effectively in an agile environment.
- Managed PostgreSQL RDS schema (10 tables, 5k rows); wrote optimized queries cutting average load time by 20%, showcasing strong analytical skills and data management.
- Reduced average page-load time from 3.2s to 1.1s by lazy-loading React components and enabling CloudFront gzip compression, cutting bounce rate by 38%, demonstrating a focus on user experience and performance optimization.

Voting Platform

PostgreSQL, Python, AWS

<https://github.com/Jsingh651/project-golf-electronic-voting>

- Built secure, high-throughput voting service in Python; supports up to 4,000 concurrent voters with < 200 ms latency, demonstrating proficiency in distributed computing.
- Implemented token-based auth, rate-limiting, and normalized MySQL schema to guarantee vote integrity, showcasing strong data management and object-oriented design principles.
- Containerized with Docker, deployed to AWS EC2 via GitHub Actions; achieved 99.9% uptime over 3 months, zero data-loss events, highlighting CI/CD practices and operational excellence.

Education

California State university - BS in Computer Science

Sacramento, CA

Coursework: Data Structures, Algorithms, Object-Oriented Design, Computer engineering

May 2027

Sierra College - AS is Computer and Natural Sciences

Rocklin, CA

Coursework: Data Science, Programming, Data engineering, Network Development

May 2025

Coding Dojo Bootcamp

Sacramento, CA

MERN, Python, Java, Design patterns | Certification in all stacks (100/100)

March 2023
